Strieber: Indian Point Energy Center:

"Historically used millions of gallons of Hudson River water daily for cooling. Thermal pollution and tritium leaks into the river ecosystem."

"The property sat right along the Shawangunk Mountains: Highly magnetized, iron-rich geological formation."

"Pine forests constantly release high levels of biogenic volatile organic compounds called terpenes (specifically alpha-pinene and beta-pinene). When inhaled, alpha-pinene crosses the blood-brain barrier. It acts as a natural acetylcholinesterase inhibitor, increasing the amount of neurotransmitters available in the brain. It drastically enhances focus, alters sleep architecture (vivid dreaming).

"Quartz is highly piezoelectric. When the tectonic plates shift, or when there is gravitational/tidal stress on the mountain ridge, the compressed quartz crystals generate literal underground electrical voltage. The iron deposits act as a massive natural antenna, concentrating this piezoelectric voltage and distorting the local magnetic field. If your brain operates on a 7–10 Hz electrical rhythm, living on top of an active, highly magnetized quartz/iron battery will cause profound neurological "static."

"15 miles east: A long history of heavy manufacturing, chemical production, and industrial contamination (including massive PCB dumping in the mid-to-late 20th century). Industrial particulate matter from the valley rises and interacts with the natural pine aerosols. When chemical pollution mixes with high-terpene forest air under specific barometric pressures, it can alter atmospheric ionization, changing how electricity flows through the air. The valley acts as a massive corridor for high-voltage power lines running down from upstate generators to New York City.

The cabin was caught between highly charged natural geology and a heavily polluted, electrically industrial valley."

"The precise timeline Strieber documents for his seminal encounter on December 26, 1985, fits seamlessly into the theory of a biophysical reaction to midnight grid shifts:

11:00 PM: Strieber and his wife Anne fell asleep.

~3:00 AM to 5:00 AM: Strieber states he woke up roughly six hours after going to sleep to a strange sound, finding himself in the middle of his experience.

From an electrical grid perspective, this timing is highly conspicuous. In the power industry, baseload discharges and grid phase transitions happen in a distinct pattern overnight:

1. The Sleep Cycle & Grid Harmonics Match

Around 2:00 AM to 4:00 AM, regional power demands drop to their lowest absolute level of the day (known as "night-time baseload"). To handle this sudden drop in consumer usage, power authorities alter how power is routed. When massive industrial users shut down for the night, it leaves excess voltage on the lines. This creates severe harmonic distortion ("dirty electricity") that spikes through the electrical lines.

Because Strieber's cabin was sitting on a highly magnetized iron-rich ridge acting as a giant ground antenna, these midnight electrical spikes would be physically concentrated directly beneath his bed."

"The time between 2:00 AM and 4:00 AM is also the biological window where human melatonin production peaks and body temperature drops to its lowest point. During this phase, your brain waves drop into the deepest slow-wave Delta state (0.5–4 Hz).

If a massive, artificial AC harmonic surge spikes through the local grid at 3:00 AM, it forcefully disrupts this natural rhythm."

"Because high-voltage lines release localized electrical discharges (corona discharge) that peak when the air cools and dampens overnight, the early morning hours see the highest concentration of ground-level air ionization. When this artificial overnight ionization collided with the volatile pine forest aerosols surrounding his cabin, it essentially turned his bedroom into a highly charged, electro-chemical chamber."

The local power grid in Accord, New York, was—and still is—owned and operated by Central Hudson Gas & Electric Corporation.

The reason "UFO" abductees [humans biologically abducted by overloaded environmental spikes] - often experience similar events, comes down to how the brain interprets the intrusion according to and within its own anatomy.
